

It's the operating system for commercial refrigeration that integrates connected infrastructure, artificial intelligence, and specialized support to transform the operation of food and beverage brands. Our solution converts data into actionable insights that optimize the technical, commercial, and environmental performance of each refrigerated unit.

## The three pillars of our service

### Infrastructure

This pillar is the physical and technological foundation upon which the entire Sensify solution is built. It includes the devices and technologies needed to collect data from the refrigerated ecosystem, enabling the digital operation of coolers, cold rooms, and similar assets.

### CoolerCloud™

CoolerCloud is the intelligence engine of Sensify OS™, which converts data collected from infrastructure into actionable insights in real time. Its unique feature is that, in some areas, it not only allows you to understand what is happening, but also to take automatic action, generating an immediate return on investment.

### Experience & Support

It's the human and strategic component of Sensify OS™. It goes beyond software and hardware: it represents active and personalized support that converts data and technology into real value for the business. Support is not an add-on, but an essential part of the service.
